1	Introduction	1
2	The Human Mind and the Ultimate Quest to Grasp the Universe	11
2.1	Plato's Legacy in Cosmology: The Geocentric Paradigm	13
2.2	Islamic Contributions: Naming and Knowing the Heavens	15
2.2.1	Ibn Al-Shatir (ابن الشاطر) and the Road to the Heliocentric Cosmos of Copernicus	16
2.3	Galileo, Kepler, and Newton: Founders of Classical Astronomy	20
3	General Relativity and the Emergence of the Black Hole Hypothesis	27
3.1	Basic Concepts of General Relativity	31
3.2	General Relativity and the Weak-Field Regime	34
3.2.1	The Case of Empty Space: $T^{\mu\nu} = 0$	38
3.2.2	The Case of a Spherically Symmetric and Static Object: $T^{\mu\nu} \neq 0$	39
3.2.3	The Effect of Rotation	41
3.3	Birkhoff's Theorem and the Hidden Interior	43
3.3.1	Gravity and the Centre of Mass (CoM)	44
3.3.2	Gravitational Interaction Between Two Bodies	47
3.3.3	The Case of Pure Spherical Symmetry	48
4	Black-Hole Candidates: Theory Versus Observation	53
4.1	Black-Hole Candidates and the Threshold of Compactness	55
4.2	The Forceful Revival of the Black-Hole Paradigm	58
4.3	Black-Hole Classes and Mass Ranges	60
4.4	Black-Hole Candidates and Their Observational Uncertainties	63
5	Neutron Stars: Hidden Holography and the Emergence of DEOs	69
5.1	Weak Compressibility Versus Pure Incompressibility of Fluids	71

5.2	The Glitch Phenomenon of Pulsars	74
5.2.1	Glitching Pulsars with $\Omega_{\text{core}} = 0$?	80
5.3	Energetics of Compression During Glitches	83
5.4	From Thermodynamic Pressure to Constraint Dynamics	86
5.5	Neutron-Star Cores and the Loss of Compressibility	88
5.6	The Emergence of Macroscopic Incompressibility	90
5.7	Holographic Surface Instabilities and Phase-Emergent Gravity	94
5.7.1	Dynamical Stability of DEO Holographic Surfaces	98
5.7.2	Phase-Emergent Gravity Versus Entropic Gravity	104
5.8	Numerical Modelling of DEO Cores in NSs	106
5.8.1	Constraining the Material Density Inside NS Cores	108
5.9	DEOs Within the Framework of General Relativity	114
5.10	Signatures of DEO Cores from Indirect Observations	116
5.11	Rotating Compact Astrophysical Objects: From Rigid-Body to Differential Rotation	125
5.12	The Black-Hole–DEO–Torus Equivalence Theorem	131
5.13	Compact-Object Mergers from the DEO Framework Perspective	137
5.13.1	The Cases of GW200105 and GW200115	140
6	The Origin of the Narrow Mass Range of Neutron Stars	145
6.1	Lower and Upper Mass Bounds	147
6.1.1	The Onset of Toroidal Configurations: The Emergence of the Upper Mass Limit	150
6.1.2	Empirical Shell-Thickness Scaling from TOV Solutions	153
6.2	PSR J0740+6620 as a Precursor to Toroid-Dominated Configurations	156
6.2.1	PSR J0740+6620 and the Origin of Its Weak Magnetic Field	158
6.2.2	Possible Origins of the Large Mass of PSR J0740+6620	159
6.3	Merger Dynamics and the Mass Growth of DEOs	160
6.3.1	The GW170817 Neutron-Star Merger and the Fate of the Remnant	162
7	Vacua in Physics and in Cosmology	165
7.1	Gravity, Vacuum Energy, and Cosmic Dynamics	167
7.2	SuSu Matter and the False Vacuum State: Further Considerations	174
8	Horizonless Giants: Supermassive DEOs Versus Supermassive Black-Holes Candidates	179
8.1	DEOs and Their Connection to the Progenitors of Big Bangs	181

CONTENTS

9 The Origin of Cosmic Flatness	189
9.1 The Flatness Problem and the Inflationary Scenario	189
9.2 An Alternative Interpretation: Flatness in the UNIMOUN Framework	194
10 The Decay of the Big-Bang Progenitor and the Emergence of the Fireball	197
10.1 The Runaway of Hadronization and the Creation of the First Elements	198
10.2 The Collapse of the SuSu Condensate	206
10.3 Dynamics During the Hadronization Phase	209
11 The Connection Between the Expanding Big-Bang Fireball and the Acceleration of Distant Galaxies	215
11.1 Revisiting the Principles of Modern Cosmology	215
11.1.1 Supernovae as Standard Candles	217
11.2 Accelerating Distant Galaxies: An Alternative Mechanism	221
12 Hubble Constant and Hubble Tension	235
12.1 The $\mathcal{H}$ -Metric and the Evolution of Spacetime Topology	237
12.2 From the Hubble Constant to the Hubble Function	239
13 UNIMOUN – The Unicentric Model of the Observable Universe	247
13.1 Λ CDM and the Cosmology of the Universe	249
13.2 The Spacetime Metric of UNIMOUN	251
13.3 The Smooth Growth of Giant Condensates	257
13.4 Abrupt Decay, Quantum Matter, and the Emergence of Gravity	260
13.4.1 The Holographic Surface and Its Stability	263
13.4.2 Toroidal-to-Spherical Assimilation as an Instability Mechanism	264
13.4.3 Emergence of the Holographic-Surface Mismatch	266
13.4.4 Holographic Information Capacity from a Cosmological Perspective	268
13.5 Thermodynamics of the Hadronization Front	271
13.5.1 The Origin of Cosmic Isotropy and Primordial Anisotropy	273
13.6 The Cosmic Coincidence from UNIMOUN’s View	277
13.6.1 The Background Temperature of the Parent Universe	278
13.7 The Recurrent Nature of Big-Bang Events in the Infinite Parent Universe	282

14 Creatio ex Nihilo and the Infinite Universe:	
The UNIMOUN Perspective	289
14.1 How Black-Hole Suppression Favours a Habitable Universe	292
14.2 Creatio ex Nihilo and the Infinite Parent Universe	294
14.2.1 The Origin of Matter in the Parent Universe	298
14.3 The UNIMOUN View of the Origin of Mathematics and Its Unreasonable Effectiveness	305
14.3.1 The Innate Roots of Human Abstraction: From Biological Adaptation to Abstract Thought	309
14.3.2 The Inevitable Emergence of Mathematics	313
14.3.3 Mathematics as an Adaptive Human Construction	317
14.4 The Origin and Universal Significance of Life	319
14.4.1 The Origin of Life: Final Conclusions	320
A Selected EOSs and Their Regimes of Validity	323
B TOV Equations: Numerical Solution Procedures	325
C Buchdahl's Limit for Uniform-Density Stars	335
D The Time-Dependent Onsager–Feynman Equation in Glitching Pulsars	339
E $\Lambda - H_0$ Connection	343
F Junction Conditions and the DEO Shell Spacetime Configuration	345
G ADM Mass	349
H The Running QCD Coupling, SuSu Matter, and Saturated Energy Exchange	353
Index	371
